

1. Rolling a die.

```
> x = c(1,2,3,4,5,6)
> probx= c(1/4,1/8,1/8,1/8,1/8,1/4)
> F16=sample(x, size=1500, replace=T, prob=probx)
```

- Describe what each R command is performing in the above.
- Using the `mean` and `var` command find the mean and variance of `F16`. From this information alone what would you conclude is the range of the random variable `F16`.
- Does the mean and variance from the sample generated compare closely with the true mean and variance of `F16`.

2. Tossing a coin 10 times.

```
> b1 = rbinom(100,10,0.5)
> b2 = rbinom(100,10,0.25)
> b3 = rbinom(100,10,0.75)
```

- Using the `?rbinom` explain what each of the above commands is performing in R
- Using the `mean` and `var` command find the mean and variance of `b1`, `b2`, `b3`. Compare them with the true mean and variance of the Binomial distribution.

3. `geom_hist` command.

```
> df1=data.frame(b1)
> p11= ggplot(df1) + geom_histogram(mapping=aes(x=b1), color="black", fill="NA", binwidth=1)
> p21= ggplot(df1) +
+   geom_histogram(mapping=aes(x=b1, y=..density..), color="black", fill="NA", binwidth=1)
```

- Explain what are the plots `p11`, `p21` providing.
- Rewrite the code to provide the plots for `b2` and `b3`.
- What can you say about the three plots ?

4. Density Approximation. The below code plots the function `density` in the interval (0,10) with $a = 5, s = \sqrt{2.5}$ along with the plot `p21`.

```
> density = function(x,a,s){ (1/((2*pi)^(0.5)*s ))* exp(-(x-a)^2/(2*s^2))}
> df1=data.frame(b1)
> p21= ggplot(df1) +
+   geom_histogram(mapping=aes(x=b1, y=..density..), color="black", fill="NA", binwidth=1) +
+   xlim(0,10) +
+   geom_function(fun=density, args=list(a=5,s=(2.5)^(0.5)))
```

- From the picture what does $\int_3^6 \text{density}(x) dx$ approximate ?
- If

$$\text{Area under the histogram between 3 and 7} \approx \int_a^b \frac{1}{\sqrt{2\pi}} \exp\left(-\frac{x^2}{2}\right) dx,$$

then what would be your guess for a and b

- How would you try the same idea for `b2` and `b3` ? Would you get the same result ?
