- 1. De Moivre's Central Limit Theorem.
 - (a) Using the rbinom generate 100 samples of Binomial(20,0.5) and plot the histogram of the data-set.
 - (b) Using the rnorm generate 100 samples of Normal(10, 5) and plot the histogram of the data set.

Think of ways you can enhance the above exercise to come up with a computer proof of the Central Limit Theorem.

- 2. Poisson Approximation
 - (a) Using the rbinom generate 100 samples of Binomial (2000,0.001), save it in a dataframe dfbinomial and plot the histogram of the data-set.
 - (b) Using the rpois generate 100 samples of Poisson(2), save it in a dataframe dfnormal and plot the histogram of the data set

Think of ways you can enhance the above exercise to come up with a computer proof of the Poisson Approximation, even though we have seen a proof in class.

3. The following result is a Berry-Eseen Type bound.

Theorem: Let $X_n \sim Binomial(n, p)$, then there exists C > 0 such that

$$\sup_{x \in R} \left| P\left(\frac{X_n - np}{\sqrt{np(1-p)}} \le x \right) - \int_{\infty}^x \frac{\exp(-\frac{y^2}{2})}{\sqrt{2\pi}} dt \right| \le \frac{(p^2 + (1-p)^2)}{2\sqrt{np(1-p)}}$$

We shall prove it by simulation by the below algorithm.

```
For x = -2,-1.9,-1,8,\ldots 0,\ldots 1.9,2 using inbuilt pnorm find z[x]:-pnorm(x)

Set p

For m = 1,50,100,150,\ldots 1000

For x = -2,-1.9,-1,8,\ldots 0,\ldots 1.9,2

1) Generate B: 1000 Samples of Binomial (m,p) using inbuilt rbinom function Compute SB: (B-m*p)/((m*p(1-p))^{\circ}(0.5))

2) Compute y[x]: the proportion of samples in SB less than equal to x

3) Repeat steps 1) and 2) 100 times and compute average --my[x] over each trial. 4) Calculate diff[m] = max(abs(my[x] - z[x]))

For m = 1,50,100,150,\ldots,1000

Calculate error(m) = [p^2+(1-p)^2]/[2*(m*p*(1-p))^{\circ}0.5]
```

Plot diff and error.

See if result is verified by picture. Can you do anything additional to verify the Theorem?
